

TECHNICAL ASSESSMENT

ROLE: SOFTWARE ENGINEERING INTERNSHIP

DESCRIPTION

The app not only facilitates a transaction, but brings people together. It's important for a renter to know something about the customer before they enter their home.

I'm giving you a blank Flutter template, and on the sign-up page, I would like you to prompt the user with, "What is your favorite bathroom you've used?" You should then store their response as a variable `favoriteBathroom` in the `User` model.

INSTRUCTIONS

Running

1. Install [Flutter](#)
2. `cd flutter-ulistings-app`
3. Open an iOS or Android simulator
4. `flutter run --no-enable-impeller`

Add the feature

- Create the text field, and populate it with hinted text before the user starts typing.
- The hinted text should come from a separate file, and upon launching the screen, you should select one of the strings at random to display within the field. Have fun! You can come up with whatever example strings you'd like.
- Store the result in the `User` model, and retrieve it on the profile screen.
- To modify:

- flutter_universal_listings/lib/listings/model/listings_user.dart
- flutter_universal_listings/lib/listings/ui/profile/profileScreen/profile_screen.dart
- firebase/functions/seed/data/users.js (You can delete the demo users.)

STYLE

- Please comment above lines of code you add.

SUBMISSION

- Please email contact@flush-app.com a screenshot of your finished sign-up screen, and add eszabo12 as a collaborator to the GitHub repository you created in the project directory.

FOLLOW-UP

I will get an update to you within 1 week!
